PROFESSIONAL ACHIEVEMENTS STATEMENT

with external validation reference

Professional	Vladimir Bernardo Acuña Valdebenito	**Period**	May 2011 - October 31, 2025
Organization	Fundación CEIS Marista	**Document**	Prepared by the professional
Employment reference	Jean Claude Dupry	**Institutional email**	jdupry@ceismaristas.cl

Scope note. This document was prepared by the professional as a formal supporting record for employment, recruitment, and experience-validation processes. The external reference included below allows validation of the employment context, working relationship, and general scope of responsibilities, without automatically attributing authorship of this document to the contact mentioned.

1. Purpose of the document

To formally and professionally document the main technical, functional, and operational continuity contributions developed by Vladimir Bernardo Acuña Valdebenito during his tenure at Fundación CEIS Marista. This document is intended to serve as professional and employment support material, presenting achievements, observable improvements, and competencies demonstrated in real operating environments.

2. Overall context of performance

During the stated period, the professional carried out technical and strategic functions related to the development, maintenance, modernization, support, automation, and integration of platforms used in real production environments. This work combined analysis, full-stack development, incident resolution, performance improvement, technical coordination, and operational continuity, while simultaneously addressing multiple workstreams and infrastructure constraints.

3. Main achievements and contributions

Technology modernization and technical debt reduction

- Participation in progressive modernization processes for legacy systems, especially in PHP environments, supporting the transition toward more current and maintainable technology foundations.
- Refactoring and improvement of critical modules, increasing readability, maintainability, stability, and future evolution potential for relevant components.
- Technical preparation of existing platforms for continuity and future improvement, even in scenarios where a full immediate overhaul was not feasible.

Performance, stability, and operational continuity

- Optimization of critical execution processes, reducing response times and improving the operational experience of internal and external users.
- Production incident handling with an analytical approach, identifying root causes, defining corrective actions, and applying preventive measures to reduce recurrence.

• Maintenance of operational continuity in contexts with technical limitations, resolving contingencies pragmatically and with commitment to service availability.

Migrations, infrastructure, and standardization

• Participation in server and platform migrations, providing technical coordination to reduce interruption risks.

• Collaboration in the standardization of configurations and environments, contributing to a more stable and controlled operation.

• Adaptation of solutions to restrictive infrastructures, achieving functional results even with limited resources.

Automation, internal tools, and integrations

• Design and implementation of internal tools and solutions aimed at addressing specific operational needs.

• Automation of manual processes, reducing operational workload, errors, and execution times.

• Support and implementation on platforms such as LimeSurvey and WordPress, together with integrations on SQL Server and MySQL.

Communications, efficiency, and applied innovation

• Implementation of mass email sending processes through PHP and Constant Contact, supporting the continuity of institutional communications.

• Proposal of alternatives aimed at reducing operating costs associated with mass communications.

• Use of artificial intelligence technologies during 2024 and 2025 to support analysis, problem solving, and the exploration of technical solutions.

Security, forensic analysis, and server resilience

• Cybersecurity training completed during the pandemic period, followed by an in-house cybersecurity talk aimed at spreading good practices.

• Forensic analysis of server attacks on more than one occasion, reviewing the available evidence to determine origin, entry vector, and scope of the incident.

• Systematic management and review of server and PHP logs during the final years of the period, with a twofold purpose: debugging code errors and detecting anomalous activity from unknown IP addresses.

• System security improvements based on OWASP ZAP testing, simulating attacks to identify weak points and apply the corresponding fixes.

• Load testing and measurement of server behavior with Apache JMeter, to size platform capacity under concurrent demand.

4. Observable results and reported improvements

• Estimated performance improvements of up to 80% in certain system processes, especially in report generation and service loading within the Batería Online platform, including the migration of part of the logic to JavaScript to optimize responsiveness.

• Estimated reduction of close to 90% in customer support processes for Batería Online between 2020 and the date of separation, supported by workflow improvements, clearer instructions, and continuity mechanisms for interruptions or connection losses.

• Approximate 45% optimization in certain components of the battery system, both at the database and code levels, through the elimination of duplication, cleanup of obsolete structures, and reorganization of information into more efficient schemes.

• Consistent completion of tasks and deliverables, adapting to both formal schedules and changing requirements arising during development.

• Early completion of scheduled tasks during 2025 and, in at least one relevant case, avoidance of external support through internal study and resolution of a problem initially projected to require a new hire.

• Simultaneous support for multiple products or work lines within the institution, reaching up to five concurrent fronts during certain periods.

5. Demonstrated competencies

Competency	Description
Architecture and development	Full-stack involvement in the analysis, development, integration, and support of production platforms.
Legacy system modernization	Ability to evolve existing systems without compromising operational continuity.
Performance optimization	Improvement of timelines, critical processes, and functional efficiency.
Incident resolution	Diagnosis, containment, and correction of production issues.
Automation and continuous improvement	Design of internal solutions, reduction of manual tasks, and sustained focus on efficiency.
Security and forensic analysis	Detection of anomalous activity, analysis of server incidents, and system hardening through security testing.

6. External validation reference

For purposes of verifying employment context, working relationship, and general scope of responsibilities, the following professional reference may be used:

Name	Jean Claude Dupry
Title	Production Manager / Fundación CEIS Orientación
Email	jdupry@ceismaristas.cl
Mobile	+56 9 9415 6984

Important: the above reference is included solely to facilitate validation of the employment and professional context. Its inclusion does not imply authorship, prior review, written approval, or issuance of this document by the person named above, unless later expressly confirmed.

7. Statement by the professional

I declare that the information presented here has been prepared in good faith, based on functions effectively performed, observed results, and available professional background. This document may be supplemented with a CV, portfolio, recommendation letter, repositories, and other supporting materials requested during an employment evaluation process.

Vladimir Bernardo Acuña Valdebenito
